

Lungenembolie/Thrombose: interventionelle Therapieoptionen

Enrique Alejandre Lafont

Lungenembolie:

Die akute Gesamt mortalität nach PE ist über zwei Jahrzehnte hinweg konstant hoch geblieben (>10%)^{1,2}

Nach PE beträgt die 30-Tage-Wiederaufnahmerate fast 25 %³

bis zu 50% der Patienten berichten nach 3–6 Monaten über anhaltende Dyspnoe, Belastungsintoleranz und/oder Funktionseinschränkungen⁴

Leitlinien schlagen Katheterverfahren erst vor, wenn Thrombolytika versagen oder kontraindiziert sind oder eine hämodynamische Verschlechterung auftritt⁵

Bei thrombolytisch basierten Behandlungsstrategien besteht aber nach wie vor ein erhebliches Blutungsrisiko, ihr Einsatz wird durch entsprechende Kontraindikationen limitiert und eine zeitintensive intensivmedizinische Überwachung ist erforderlich

Die mechanische Embolektomie reduziert die Rechtsherzbelastung schnell und sicher,

Komplikationen sind selten (in 3 Jahren Einsatz am KSSG keine Major Komplikation, kein Todesfall)

6.6 Recommendations for acute-phase treatment of high-risk pulmonary embolism^a

Recommendations	Class ^b	Level ^c
It is recommended that anticoagulation with UFH, including a weight-adjusted bolus injection, be initiated without delay in patients with high-risk PE.	I	C
Systemic thrombolytic therapy is recommended for high-risk PE. ²⁸²	I	B
Surgical pulmonary embolectomy is recommended for patients with high-risk PE, in whom thrombolysis is contraindicated or has failed. ^d ²⁸¹	I	C
Percutaneous catheter-directed treatment should be considered for patients with high-risk PE, in whom thrombolysis is contraindicated or has failed. ^d	IIa	C
Norepinephrine and/or dobutamine should be considered in patients with high-risk PE.	IIa	C
ECMO may be considered, in combination with surgical embolectomy or catheter-directed treatment, in patients with PE and refractory circulatory collapse or cardiac arrest. ^d ²⁵²	IIb	C

Venous Lactate & adverse outcomes in Normotensive PE

European Journal of Internal Medicine

journal homepage: www.elsevier.com/locate/ejm

Original article

Venous lactate improves the prediction of in-hospital adverse outcomes in normotensive pulmonary embolism

Matthias Ebner ^{a,b}, Charlotta F. Pagel ^c, Carmen Sentler ^c, Veli-Pekka Harjola ^d,
Héctor Bueno ^{e,f,g}, Markus H. Lerchbaumer ^h, Karl Stangl ^a, Burkert Pieske ^{b,i,j}, Gerd Hasenfuß ^{c,k},
Stavros V. Konstantinides ^{l,m}, Mareike Lankeit ^{b,c,i,l,*}

Results: An optimised venous lactate cut-off value of 3.3 mmol/l predicted both, in-hospital adverse outcome (OR 11.0 [95% CI 4.6–26.3]) and all-cause mortality (OR 3.8 [95%CI 1.3–11.3]). The established cut-off value for

Conclusion: Venous lactate above the upper limit of normal was associated with increased risk for adverse outcomes and an optimised cut-off value of 3.3 mmol/l predicted adverse outcome and mortality. Adding venous lactate to the 2019 ESC algorithm may improve risk stratification. Importantly, the established cut-off value for arterial lactate has limited specificity in venous samples and should not be used.

Heart rate predicts mortality in acute symptomatic PE

[Pulmonary and Cardiovascular Original Research]

Heart Rate and Mortality in Patients With Acute Symptomatic Pulmonary Embolism

Ana Jaureguizar, MD; David Jiménez, MD, PhD; Behnoor Bikdeli, MD; Pedro Ruiz-Artacho; Alfonso Muriel, PhD; Victor Tapson, MD; Raquel López-Reyes, MD, PhD; Beatriz Valero, MD; Gili Kenet, MD; Manuel Monreal, MD, PhD; and the Registro Informatizado de la Enfermedad TromboEmbólica Investigators*

INTERPRETATION: In nonhypotensive patients with acute symptomatic PE, a high HR portends an increased risk of all-cause and PE-related mortality. Modifying the HR cutoff in the sPESI and the Bova score improves prognostication of patients with PE.

CHEST 2021; ■(■):■-■

BACKGROUND Patients with acute pulmonary embolism (PE) and hypotension (high-risk PE) have high mortality.

Cardiogenic shock can also occur in nonhypotensive or normotensive patients (intermediate-risk PE) but is less well characterized.

OBJECTIVES The authors sought to evaluate the prevalence and predic-

METHODS Intermediate-risk PE patients in the FLASH (FlowTriever hemodynamics) registry undergoing mechanical thrombectomy with the FlowTriever device were included. The primary outcome was the prevalence of normotensive shock (systolic blood pressure ≥ 90 mm Hg). A composite shock score consisting of markers of right ventricular function (elevated serum B-type natriuretic peptide, moderately/severely reduced right ventricular ejection fraction), and potential additional embolization (concomitant deep vein thrombosis) was prespecified and assessed for its ability to identify normotensive

Tab. 3.5: Risikostratifizierung bei nachgewiesener Lungenembolie und frühe Sterblichkeit (30-Tages-Mortalität) (216, 336)

Frühmortalität (innerhalb von 30 Tagen)	Schock oder Hypotension	sPESI ≥ 1	RV-Dysfunktion in EchoKG oder CTPA	Kardiale Biomarker (z.B. Troponin, NT-proBNP)	Anteil der Patienten*

Get rights and content ↗

RESULTS Over one-third of intermediate-risk PE patients in FLASH (131/384, 34.1%) were in normotensive shock. The normotensive shock prevalence was 0% in patients with a composite shock score of 0 and 58.3% in those with a score of 6 (highest score). A score of 6 was a significant predictor of normotensive shock (odds ratio: 5.84; 95% CI: 2.00-17.04). Patients showed significant on-table improvements in hemodynamics post-thrombectomy, including normalization of the cardiac index in 30.5% of normotensive shock patients. Right ventricular size, function, dyspnea, and quality of life significantly improved at the 30-day follow-up.

CONCLUSIONS Although hemodynamically stable, over one-third of intermediate-risk FLASH patients were in normotensive shock with a depressed cardiac index. A composite shock score effectively further risk stratified these patients.

Mechanical thrombectomy improved hemodynamics and functional outcomes at the 30-day follow-up.

sPESI can not discriminate between the groups
17.4% of patients with shock had a sPESI score of 0

ction complicated by
n without hypotension:
al registry ☆

Survey D White DSc^b, Lynn A Sleeper (ScD)^c,

The SHOCK trial registry prospectively enrolled patients with suspected cardiogenic shock complicating acute myocardial infarction

Cardiogenic shock is usually characterized by inadequate cardiac output and sustained hypotension. However, following a large myocardial infarction, peripheral hypoperfusion can occur with relatively well maintained systolic blood pressure, a condition known as nonhypotensive cardiogenic shock

Limitations of traditional Risk Stratification

“Our current definition and risk stratification tools may not be sufficient to identify these [patients at risk of hemodynamic decompensation] with submassive PE.”²

Porcaro, et al¹; Khandhar, et al.²

~40%

of normotensive PE patients
are in **cardiogenic shock***

FLASH Registry Analysis³

~20%

of PE patients with sPESI=0 are
in **cardiogenic shock****

*Porcaro et al defined low CI defined as <2.2 L/min/m², Khandhar et al defined low CI defined as <1.8 L/min/m²

**Low CI defined as <2.0 L/min/m²

2. Khandhar et al. Invasive hemodynamic assessment of patients with submassive pulmonary embolism. Catheter Cardiovasc Interv. 2019;1-6.

3. FLASH Registry results. Presented at SCCM 2022.

Many normotensive, even sPESI=0, patients present with low cardiac index, indicative of cardiogenic shock

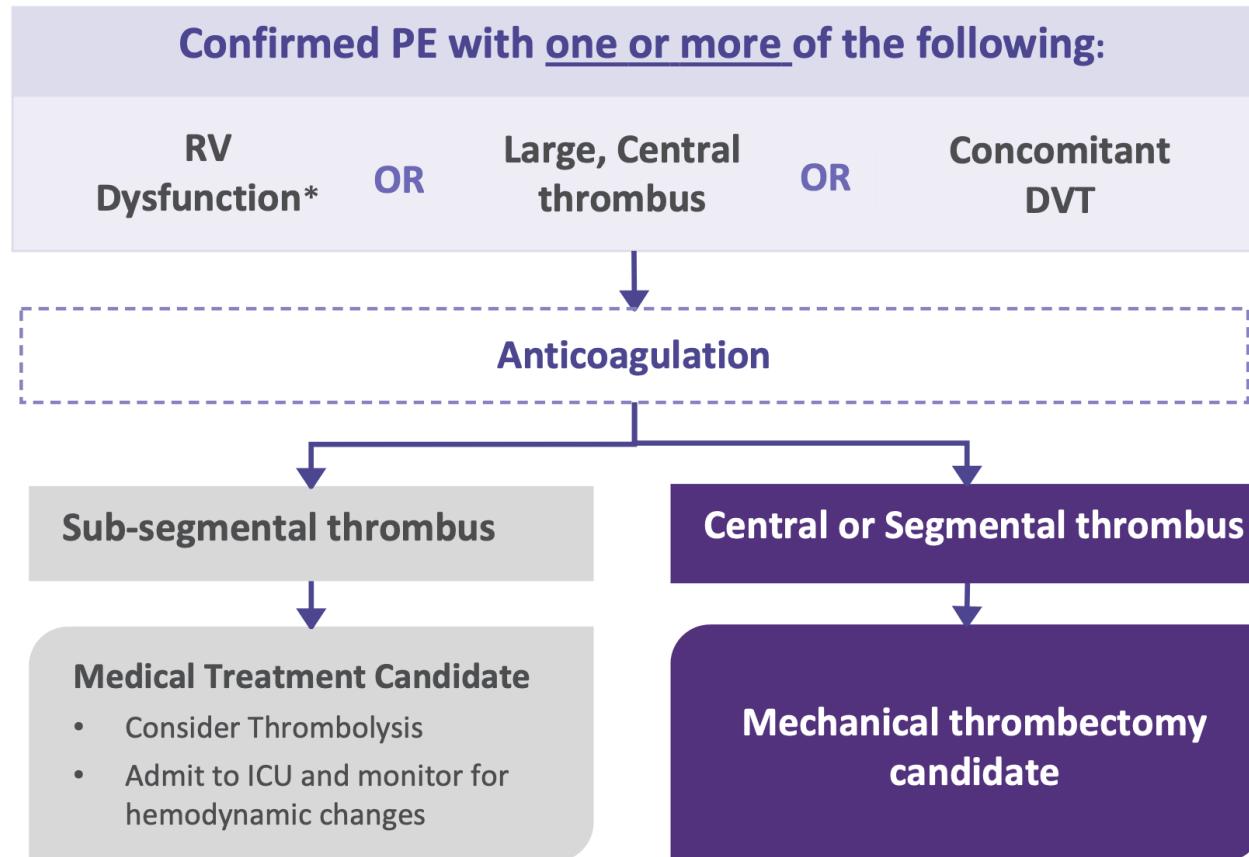

The composite shock score by Bangalore et al. helps to predict which normotensive patient is at high risk of shock

Herzindex: Herzminutenvolumen bezogen auf die Körperoberfläche
(HI = HMV/Körperoberfläche (m^2)). Einheit l/min/ m^2 .

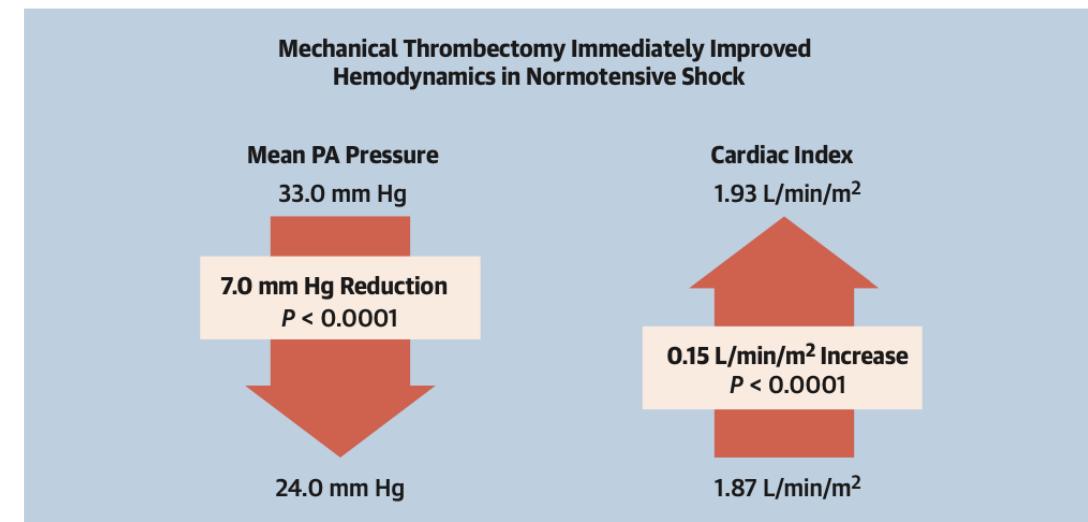

A composite shock score consisting of 1 point each for elevated troponin, elevated B-type natriuretic peptide, concomitant deep vein thrombosis, saddle pulmonary embolism, moderately or severely reduced right ventricular function, and tachycardia was calculated for each patient who had data available for all 6 components. Bars represent the proportion of patients with shock out of all patients who had a given score.

Modern PE treatment plan that considers major predictors of adverse events

Normotensive patients may be sicker than they appear:
Consider lactate, cardiac index, AKI, and HR.

*defined as: RV/LV > 0.9^{1,2,3}, RV hypokinesis on ECHO^{4,22}, or elevated cardiac Biomarkers²¹

How we do it: Setting

- Anaesthesiological Survience (TEVAR/f-bEVAR Setting)
- US guided Puncture of a femoral vein, Local anaesthesia (10cc Lidocain 1%)

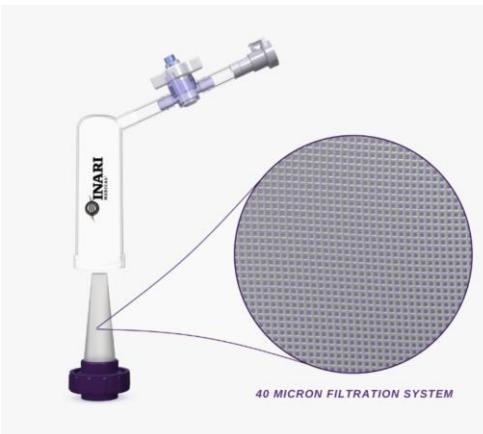

How we do it: Sheathless Access

- US guided Puncture of a femoral vein, Local anaesthesia (10cc Lidocain 1%)
- Insertion of an 8F Sheath
- 6F Pigtail + Stiff Terumo Wire -> PA access into the right lower PA
- Change to Amplatz Superstiff Short Tip Wire
- Insert 2nd wire through 8F Sheath
- US guided LA with another 10ml Lidocain 1% around the 8F Sheath
- Remove 8F sheath + insert it over the Terumo Stiff Wire, parallel insertion of a 14F sheath over the Amplatz wire)
- Remove 14F Sheath + 8F Sheath and insert 24F INARI FlowTriever
- If it doesn't enter use 8F parallel to the Triever to help

How we do it: Procedure

1. Pressure measurement in the PA
2. Angiography (Fluoroscopy, no DSA)
3. 2-3 x Aspiration
4. Use Flow Saver
5. Angiography and Pressure measurement
6. Repeat until significant pressure drop

70yo woman

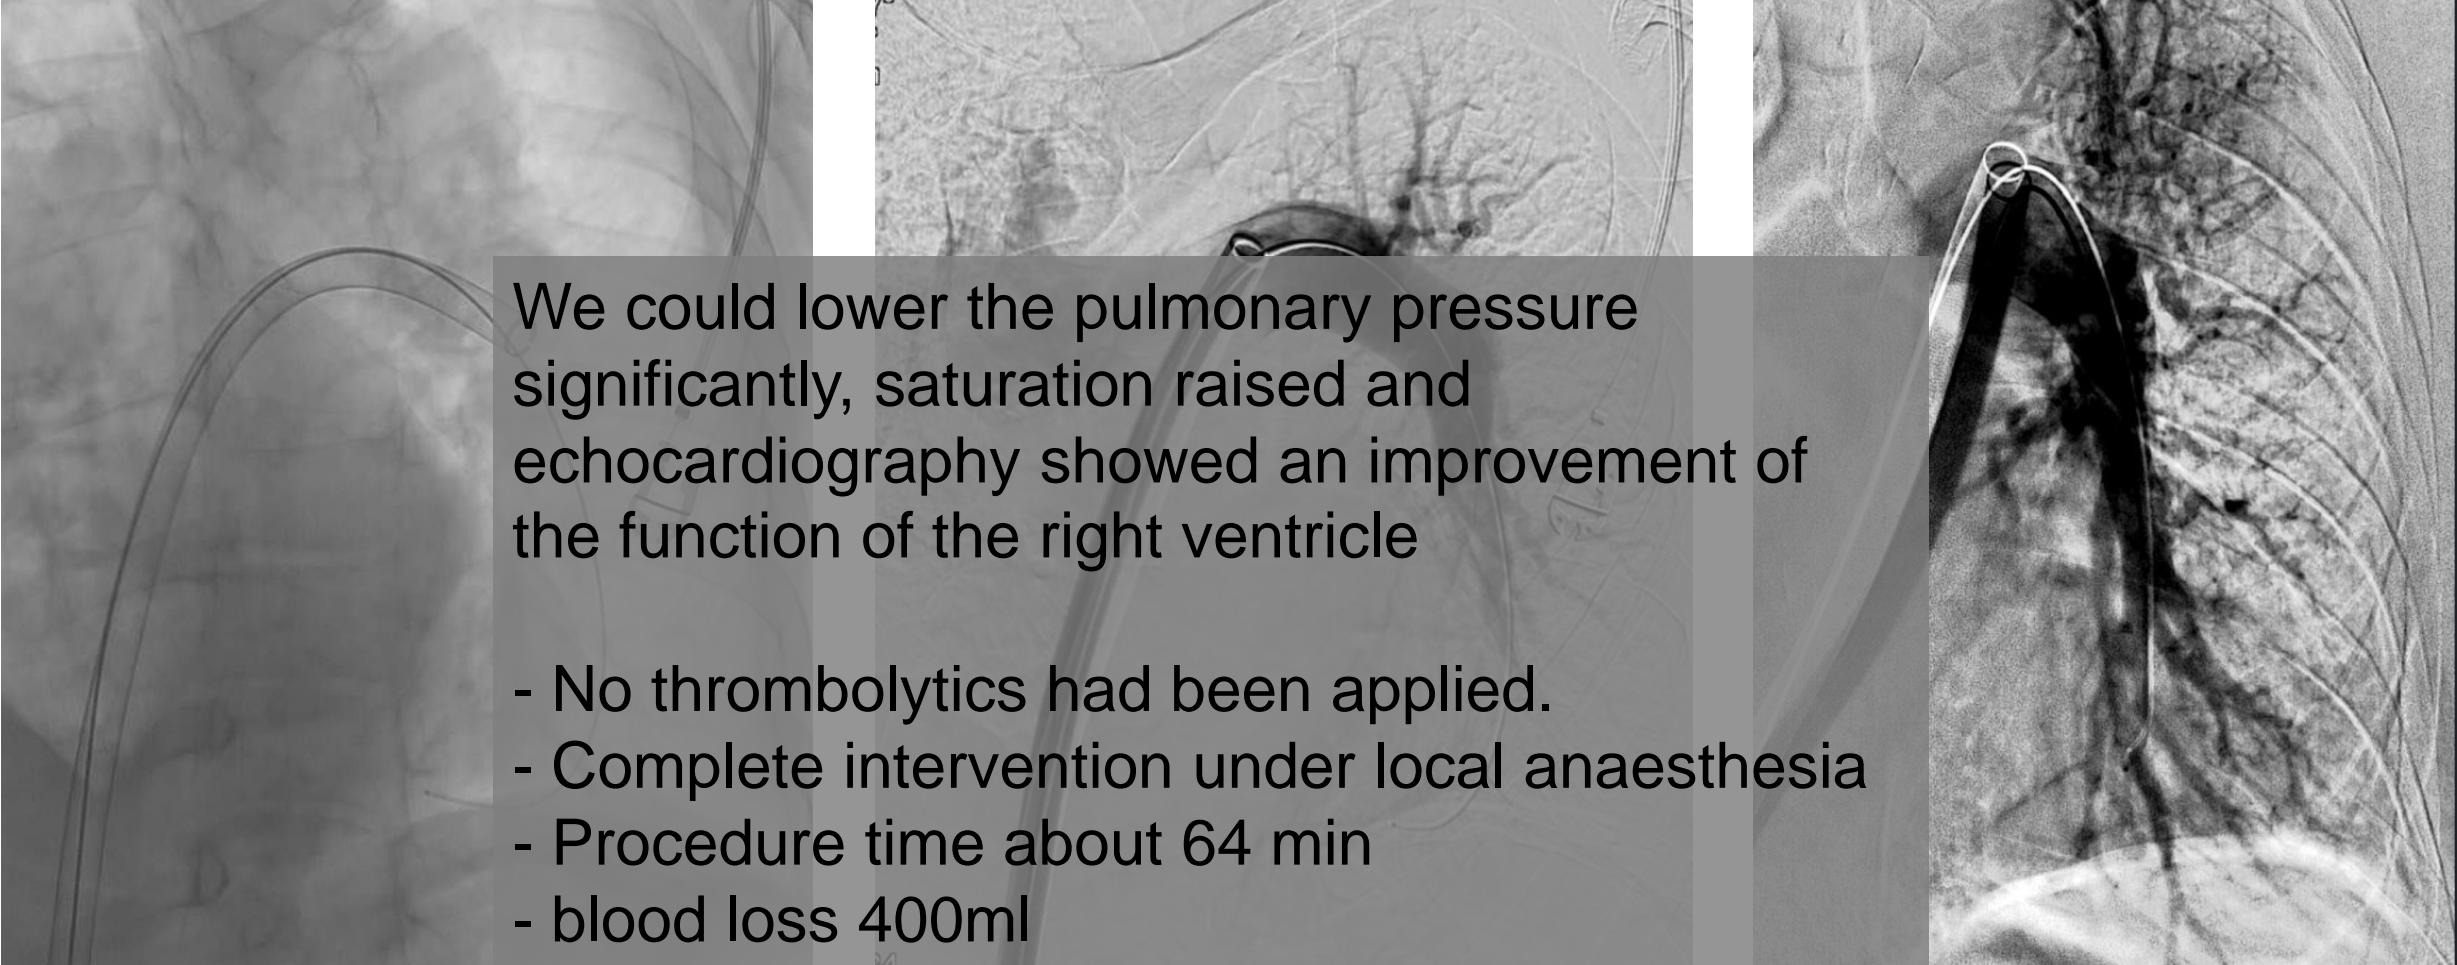

symptomatic pulmonary embolism 4 days after abdominal surgery

Haemodynamic unstable

BP sys < 90 mmHg > 15 min or Need of Vasopressors and Hypoperfusion of vital organs Laktat ↑
(no other explanations like Hypovolemia , Sepsis or Arrhythmia)

repetition of the procedure in the left lobe.

We could lower the pulmonary pressure significantly, saturation raised and echocardiography showed an improvement of the function of the right ventricle

- No thrombolytics had been applied.
- Complete intervention under local anaesthesia
- Procedure time about 64 min
- blood loss 400ml

Next day the patient was discharged from ICU and fully recovered

55 yo man with metastatic bladder cancer

sudden onset of respiratory distress

CT revealed central pulmonary embolisms

PESI SCORE 185

Elevated RV/LV RATIO

O₂ saturation 87% under 10 liter O₂/min

Sheathless access right femoral vein with a 24 F INARI

Flowtriever in local anaesthesia.

PAP 45/17/27

ACT 345s

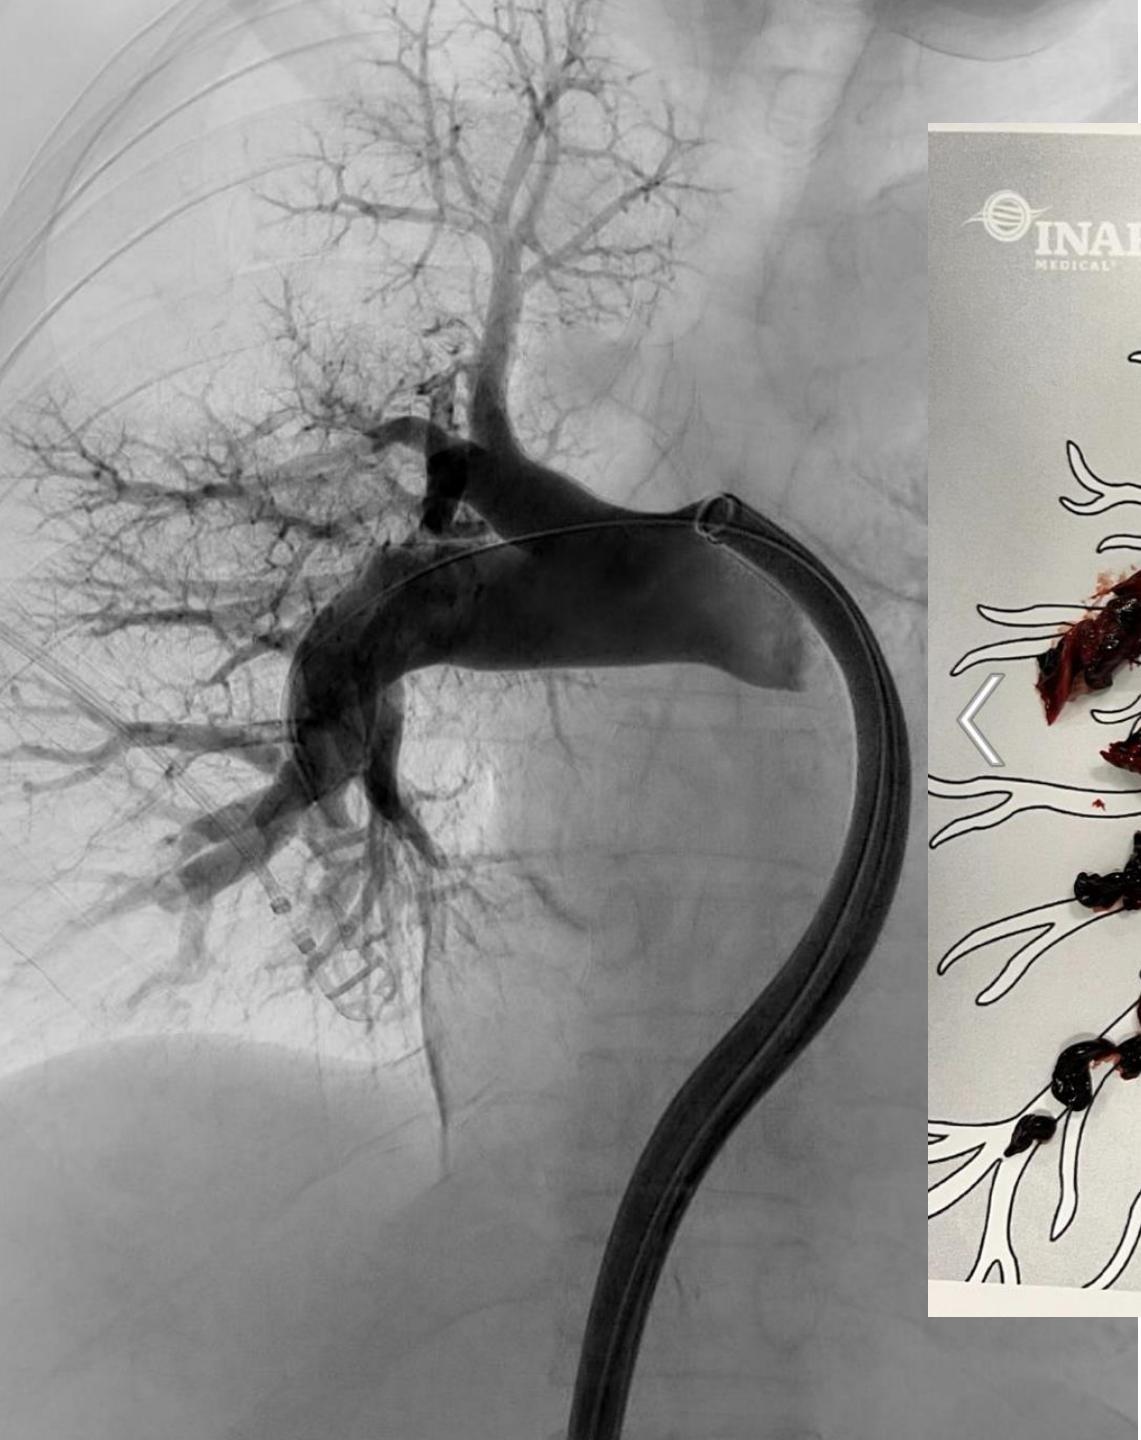

2 aspirations on the left and 2 on the right side.

PAP 22/9/15

O₂ saturation after Aspiration 96% at 3l O₂

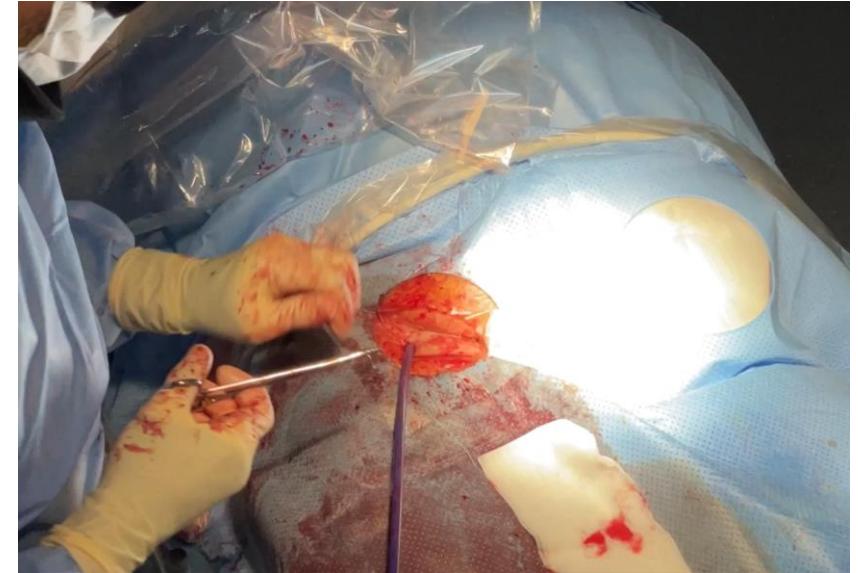

Total procedure time 35 min

Access Closure

- Leave the Sheath in place
- Mersilene 0/0 and a big Needle Holder
- Z-Suture around the sheath
- Insert both ends through a 2-way Stop Cock
- Remove the Sheath and tighten the suture
- Close the Stop Cock as far as possible
- Pressure Bandage
- Remove the bandage and the Suture after 6 hours
- Mobilization possible if the puncture side is ok

Algorithmus massive/submassive LE KSSG für externe Spitäler

This year's Best Scientific Paper Award went to Dr. Enrique Alejandre-Lafont for his presentation "[Large-bore mechanical thrombectomy for intermediate- and high-risk pulmonary embolism: interim results from the European cohort of the FLASH registry](#)." The Scientific Programme Committee bestows this honour on one presenter every year based on their own evaluation and feedback from session attendees.

Zusammenfassung

Die Prognose konservative behandelter Patienten mit >/= intermediate high Risk LE bleibt eingeschränkt:

- Sterblichkeit 10–16 % nach 30 Tagen (... 90 Tage? 6 Monate?!...)
- 20–50 % haben einen verbleibenden Thrombus
- Bei vielen kommt es zu langfristigen Funktionseinschränkungen

PERT-Team und der Algorithmus sind entscheidend

Bei der Einführung der mechanischen Thrombektomie als Behandlungsoption für Patienten mit Lungenembolie ist der Aufbau eines PERT-Teams und ein definierter, auf das jeweilige Krankenhaus zugeschnittener Algorithmus entscheidend

Die herkömmliche Risikostratifizierung reicht nicht aus, um alle Patienten zu identifizieren, die von einer Intervention profitieren könnten

- Mehrere Prädiktoren für unerwünschte Ereignisse werden ausgeschlossen (Embolieausmass, reitender Embolus, Herzindex, TVT, Laktat ...)
- Normotensive Patienten sind oft kräcker, als sie scheinen („Normotensiver Schock“)
- Die moderne Risikostratifizierung sollte Prädiktoren für kurz- und langfristige Ergebnisse, Restthrombus und neuere, lytikfreie Behandlungsoptionen (und z. B. zusammengesetzter Schockscore) umfassen.

TVT Epidemiologie

- Inzidenz 50-100/100000, mindestens 25% davon entwickeln eine LE¹
- Inzidenz verdoppelt sich alle 10 Lebensjahre
- Frauen stärker betroffen zwischen 20-45Lj, Männer stärker betroffen zwischen 45.-60. LJ
- 50% der Patienten mit TVT, die konservativ behandelt werden entwickeln ein PTS²

1/12 mittelalten Menschen entwickelt in seinem restlichen Leben eine LE oder ein PTS

60% aller LE's geschehen bei >65jährigen

Mehr TVT's im Winter, Peak im Februar

TVT Rezidiv bei TVT ohne ersichtliche Ursachen (unprovoziert): im ersten Jahr 10%, 30% nach 5-8 Jahren

Rekanalisationsrate unter konserv. Therapie: Unterschenkelvenen 80%, Iliakalvenen 20%

Akute TVT = <14 Tage -> Optimal für Interventionelle Therapie!

Subakute TVT 14 Tage bis 3 Monate

Chronische TVT > 3 Monate

1. Kakkos SK, Gohel M, Baekgaard N, et al. (2021) European Society for Vascular Surgery (ESVS) 2021 Clinical Practice Guidelines on the Management of Venous Thrombosis. Eur J Vasc Endovasc Surg 61(1):9-82.

2. Vedantham S, Goldhaber SZ, Julian JA, et al. (2017) ATTRACT trial results. Pharmacomechanical Catheter-Directed Thrombolysis for Deep-Vein Thrombosis. N Engl J Med 377:2240-2252.

Hauptziel Interventionelle Therapie

- Vorbeugung oder Verringerung der Schwere des postthrombotischen Syndroms durch Wiederherstellung der venösen Durchgängigkeit und Erhaltung der Klappenfunktion
- Verringerung des Risikos einer Lungenembolie und wiederkehrender TVT
- Sofortige Linderung der Symptome, deren Besserung mit einer Antikoagulation allein sonst viele Tage bis Wochen dauern kann.

Ilioferiales Segment sollte involviert sein (darunter eher konservativ)

TVT Risikofaktoren

- Unprovoziert: keine Risikofaktoren
- Risikofaktoren: hereditär oder erworben
- Beispiele:

ESVS 2021 Management Guidelines for Venous Thrombosis

Table 5. Core hereditary and acquired thrombophilias	
Thrombophilia	
Hereditary	
Antithrombin deficiency	
Protein C deficiency	
Protein S deficiency	
Factor V Leiden	
Activated protein C resistance*	
Prothrombin G20210A variants	
Dysfibrinogenaemia	
Factor XIII 34val	
Fibrinogen (G) 10034T	
A and/or B alleles of the ABO blood group	
Prothrombin Yukuhashi (II R596L)	
Acquired	
Antiphospholipid antibodies on two occasions more than 12 weeks apart. Three assays are performed:	
• lupus anticoagulant	
• anticardiolipin antibodies	
• anti-beta-2 glycoprotein I antibodies	
Paroxysmal nocturnal haemoglobinuria	
Myeloproliferative syndromes with JAK2V617F mutation	
Other causes	
Haemolytic states, e.g., sickle cell crises	
Any inflammatory disease such as infections, e.g., pneumonia, rheumatoid arthritis, inflammatory bowel disease, systemic lupus erythematosus, Adamantiades-Behçet disease.	
Nephrotic syndrome (loss of antithrombin in the urine)	

* Not everyone has factor V Leiden.

Olaf M, Cooney R. Deep venous thrombosis. Emerg Med Clin North Am 2017;35:743e70.

APS (x20-80), Faktor V Leiden (x3-8 heterozygot, 20-80 homozygot), Übergewicht, Onkologische Grunderkrankung, Trauma/Immobilisierung, Hormontherapie/abusus, Schwangerschaft, Nicht-O-Blutgruppe (2x), Protein c/Protein-S Mangel, Diabetes, Bluthochdruck, May-Thurner Syndrom bzw. Kompression von aussen (Tumore, Osteophyten, ...)

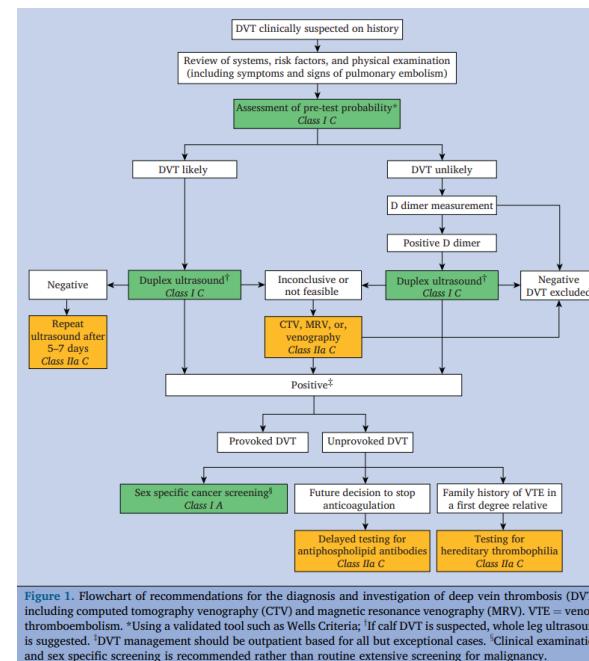

Figure 1. Flowchart of recommendations for the diagnosis and investigation of deep vein thrombosis (DVT), including computed tomography venography (CTV) and magnetic resonance venography (MRV). VTE = venous thromboembolism. *Using a validated tool such as Wells Criteria; †If calf DVT is suspected, whole leg ultrasound is suggested. ‡DVT management should be outpatient based for all but exceptional cases. §Clinical examination and sex specific screening is recommended rather than routine extensive screening for malignancy.

Single session pharmaco-mechanical thrombectomy for DVT also works well with comparable results to more prolonged catheter directed thrombolysis:

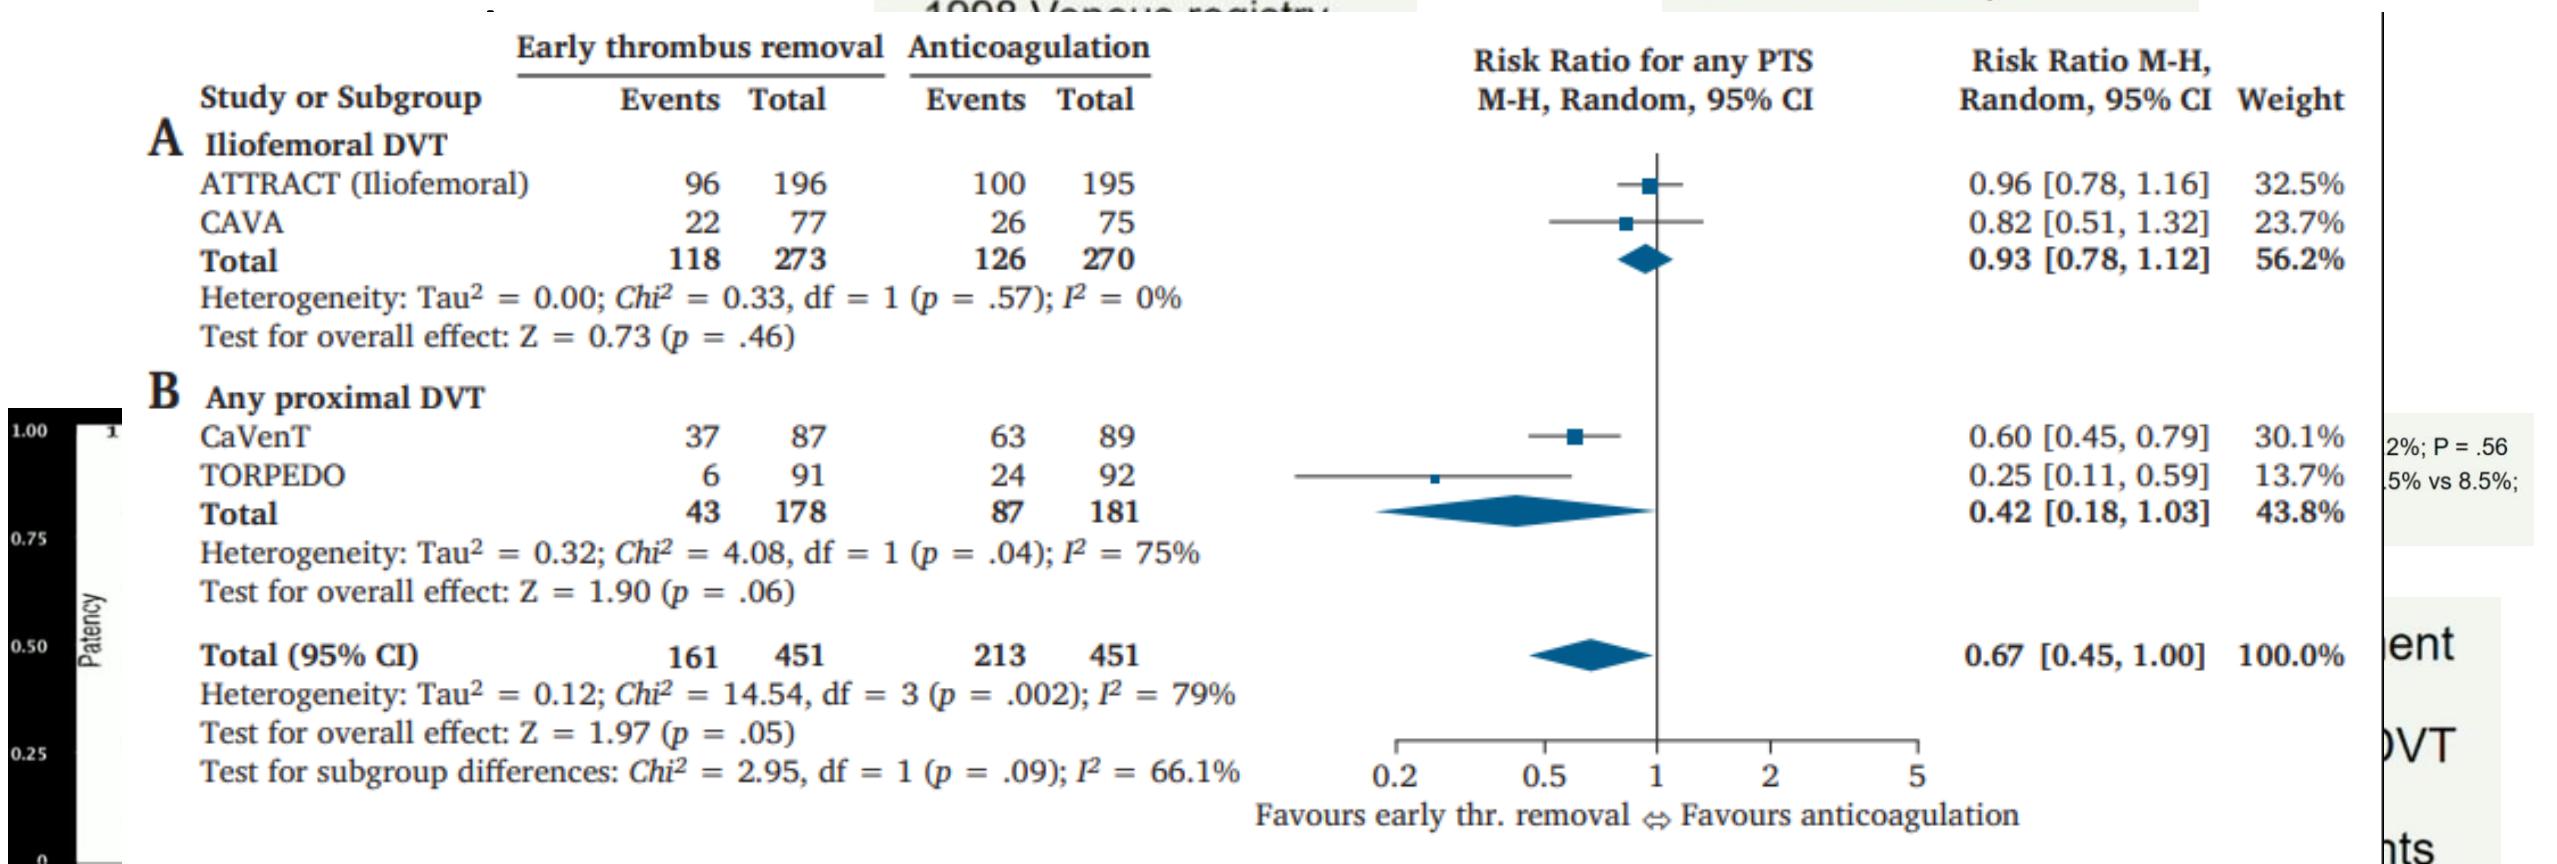

Figure 4. Forest plot analysis of randomised controlled trials comparing early thrombus (thr.) removal techniques with anticoagulation alone regarding the outcome of any post-thrombotic syndrome (PTS) in patients with (A) iliofemoral deep vein thrombosis (DVT) or (B) any proximal DVT. PTS incidence was lower with early thrombus removal techniques than anticoagulation alone. Risk ratio is based on fixed Mantel–Haenszel (M-H) method. There was no significant subgroup difference. CI = confidence interval; ATTRACT = Acute Venous Thrombosis: Thrombus Removal with Adjunctive Catheter-Directed Thrombolysis; CAVA = CAtheter Versus Anticoagulation Alone for Acute Primary Iliofemoral DVT; TORPEDO = Thrombus Obliteration by Rapid Percutaneous Endovenous Intervention in Deep Venous Occlusion.

- Treat the patient not the pictures!!!!
- What is their life expectancy?
- What was their quality of life before this episode?
- What was their leg like before this episode?
- Can they hold still?
- Are they intelligent enough to understand the risks/benefits and alternatives?
- Are they reliable enough to take regular medication?

Indikation für IVC Filter während Intervention

- Large Volume PE
- Rechtsherzbelastungszeichen
- IVC Thrombus
- Keine Stenosen (May-Thurner)
- Wenig erfahrener Interventionalist

Postinterventionelle Therapie

- Pneumatische Kompression in der ersten Nacht
- Klasse II Kompressionssstrümpfe
- US am ersten postinterventionellen Tag
- Min. 3 Monate Antikoagulation
- INR 2,5-3,5
- CT nach 6 Wochen
- Filterentfernung (Denali) falls CT unauffällig

Table 15. Suggested duration of anticoagulation in relation to stratification of the risk of venous thromboembolism recurrence.		
Risk of recurrence	Duration of anticoagulation	Underlying risk factors
High	Indefinite anticoagulation, unless there is a high risk of bleeding	Active cancer, persistent major risk factor, e.g., chronic rheumatic disorder, severe thrombophilia*
Medium	Equipoise: consider extended anticoagulation, preferably with lowest bleeding risk	Recurrent venous thromboembolism
		Unprovoked event
		Minor, soft, and transient risk factor, e.g., travel
		Male sex, obesity, heart failure, chronic obstructive pulmonary disease/significant comorbidities
		Pulmonary embolism (more likely to continue) vs. deep vein thrombosis
Low	Stop anticoagulation (3 mo)	Clear and major transient risk factor (e.g., surgery, leg injury with a reduced mobility, confined to bed in hospital)
		Combined oral contraceptives or hormonal therapy – now discontinued; pregnancy†, puerperium
		Calf vein thrombosis

* Severe thrombophilia = antithrombin deficiency, antiphospholipid syndrome, homozygous FV Leiden or prothrombin 20210 mutation, combination thrombophilia. Definitions modified from Kearon *et al.*, 2016,⁴⁴ and Prins *et al.*, 2018.¹²²

† Treatment should continue for three months and at least until the end of puerperium (6 weeks post partum).

Recommendation 34

In selected patients with venous thrombosis, early thrombus removal considered.

Class	Level
IIa	A

be at least as long as if the patients were treated by anticoagulation alone and at the discretion of the treating physician.

Case Example

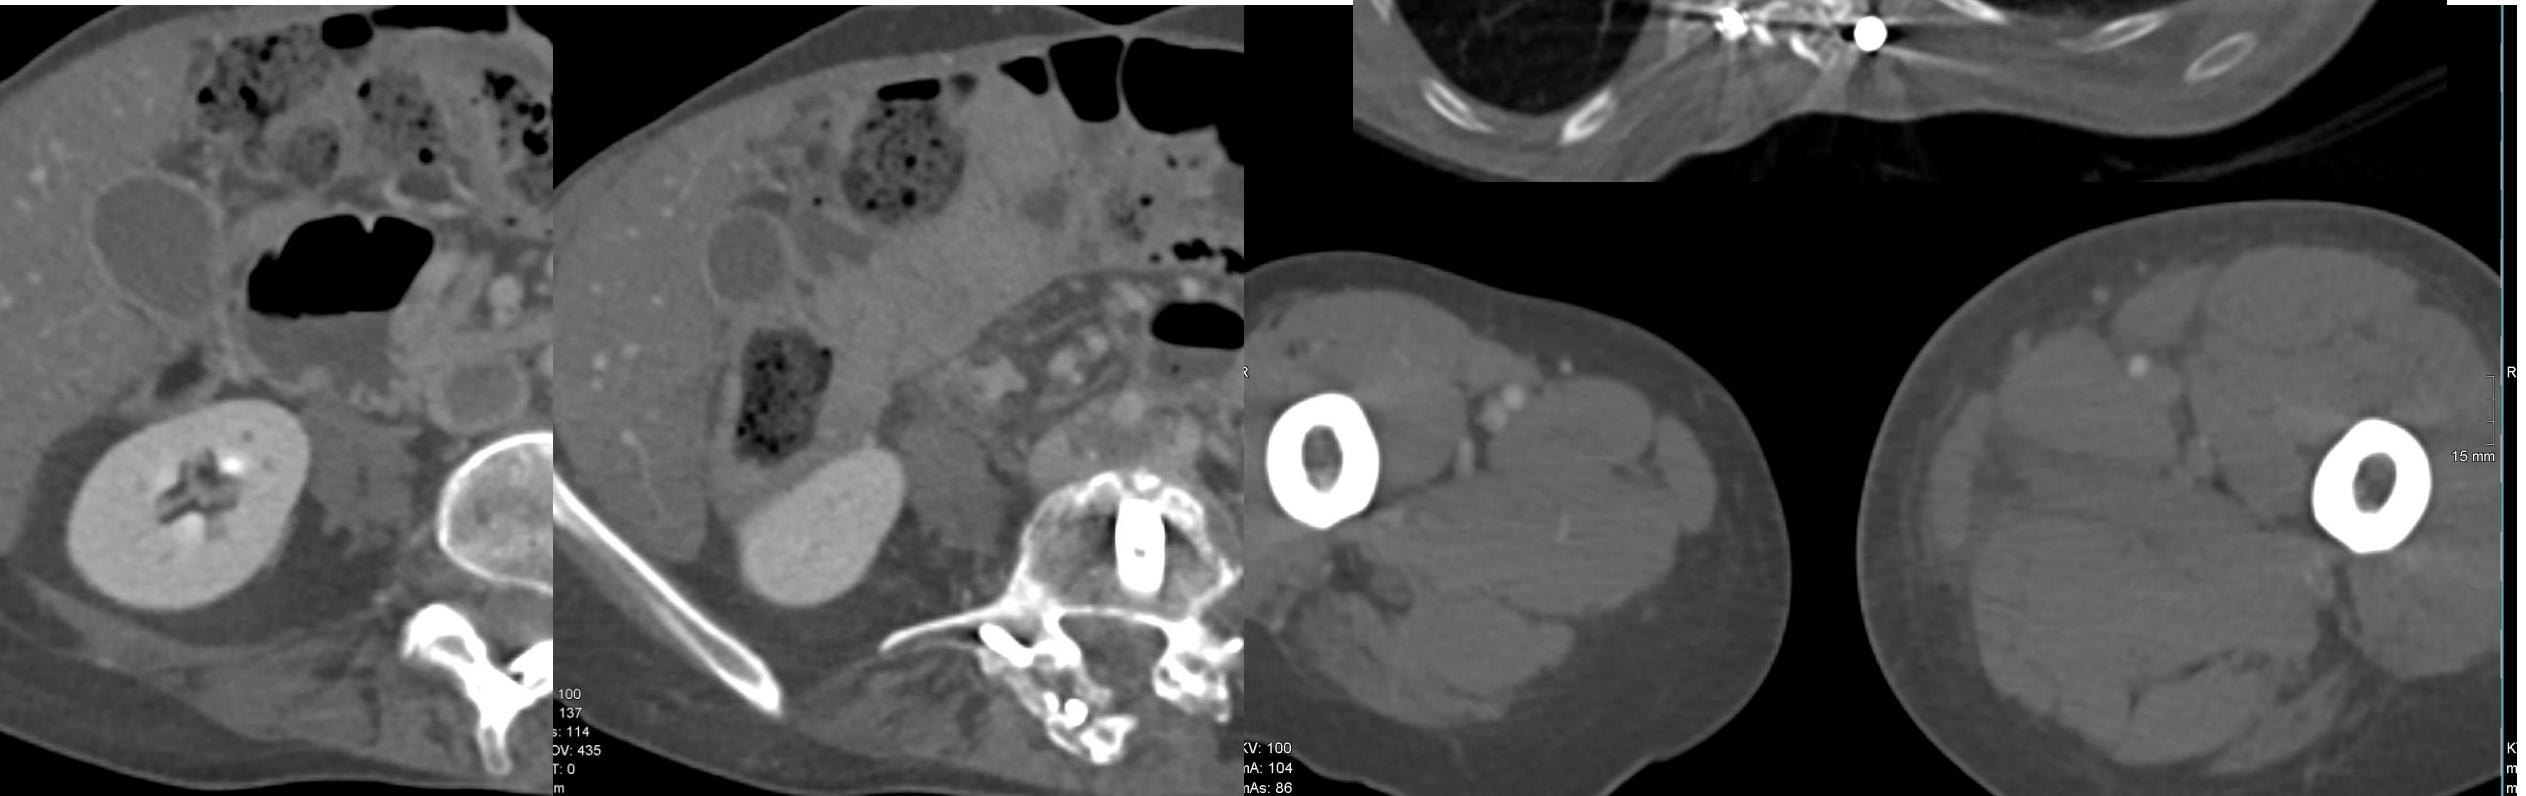

Selbständige Frau, Jahrgang 1962

4-Etagen Thrombose

May-Thurner

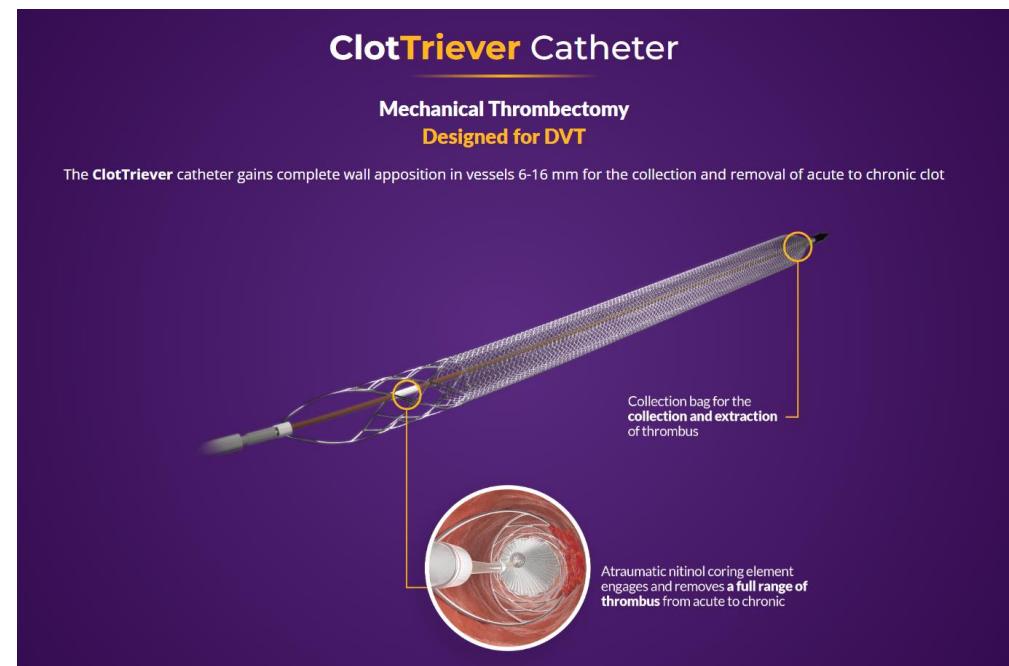

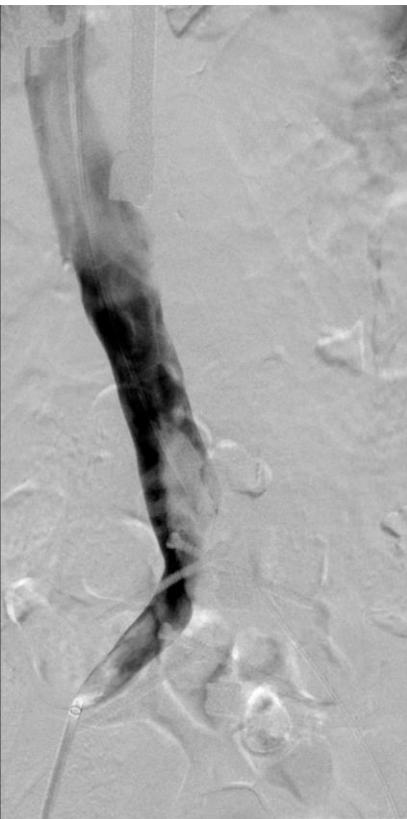

Vermehrte Immobilisation nach Zahnbehandlung 04.02.24

Tochter hat nachgewiesene heterozygote Faktor V Leiden M

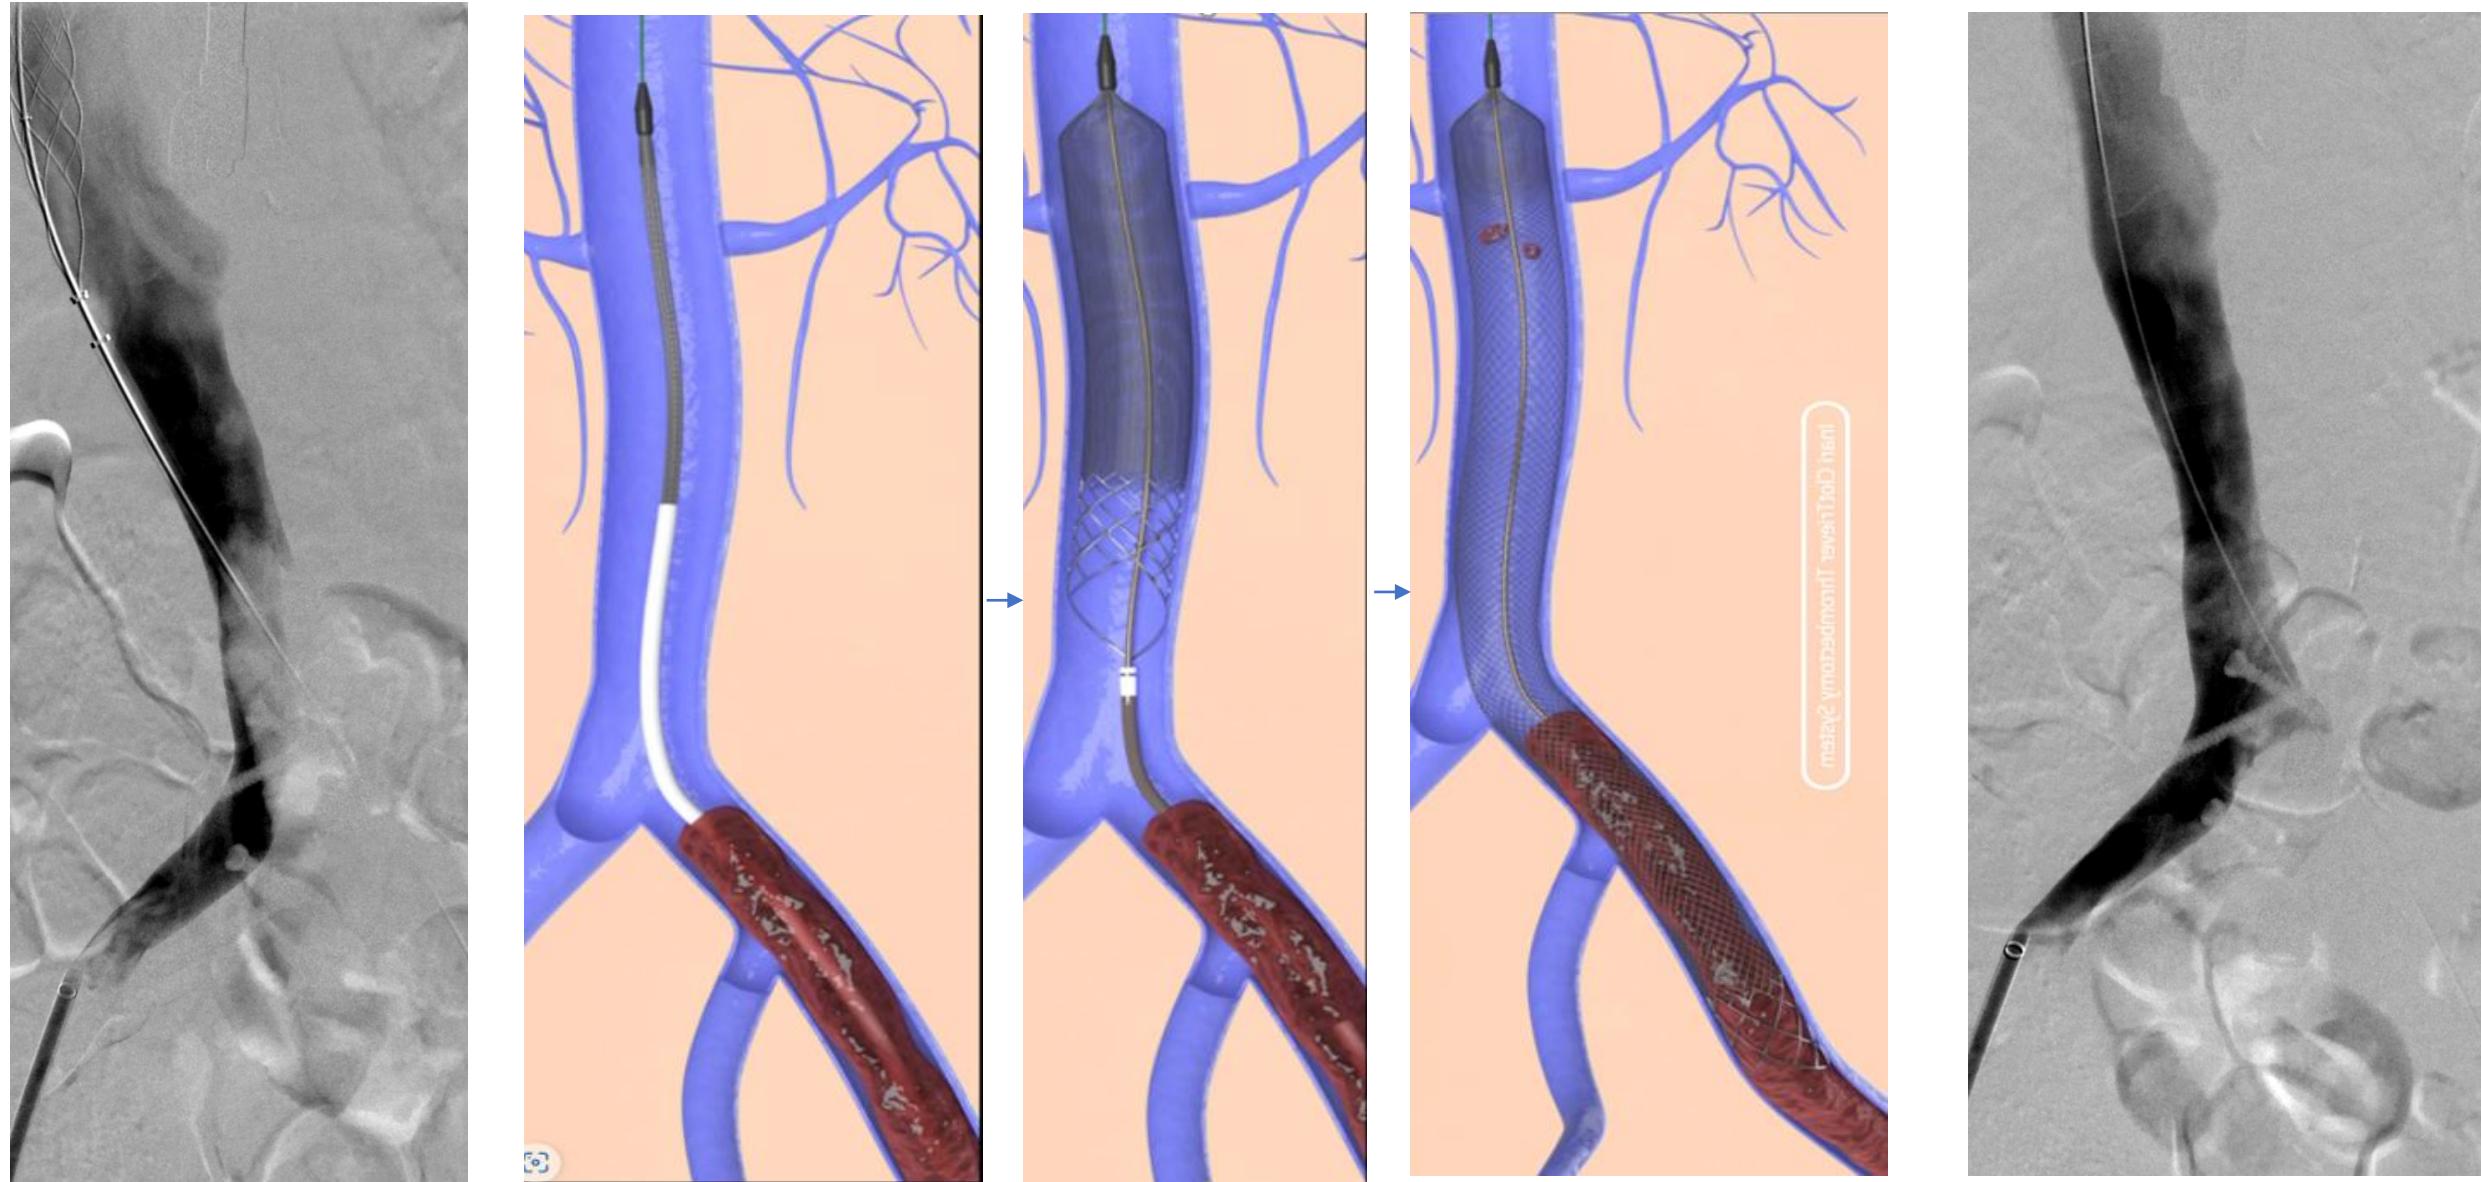

Thrombektomie am 15.2.24

- ITN
- Zugang rechts inguinal und links popliteal (Frog-Leg-position)

Clot-Triever Prozedur

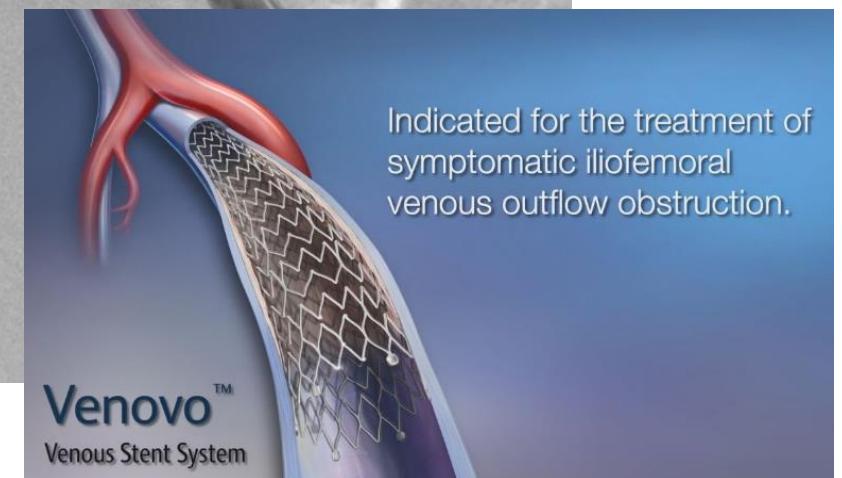

Was nun?

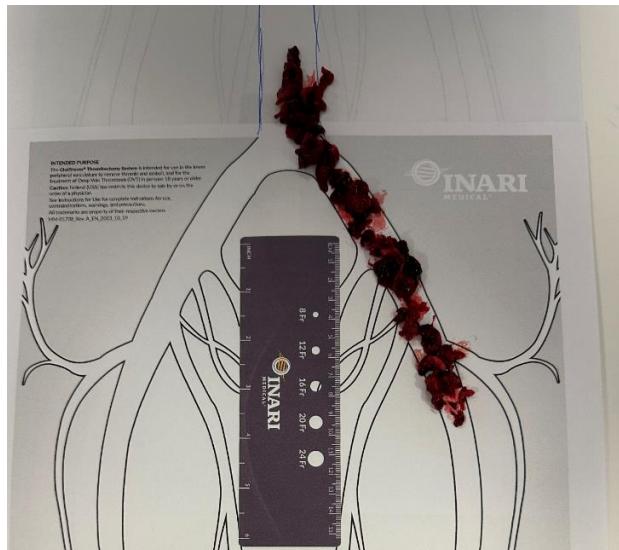

Venovo 16/80

- Entlassung beschwerdefrei am Folgetag
- Angiologische Untersuchung mit normalem venösen Flussmuster iliofemoral. Keine Restthromben.

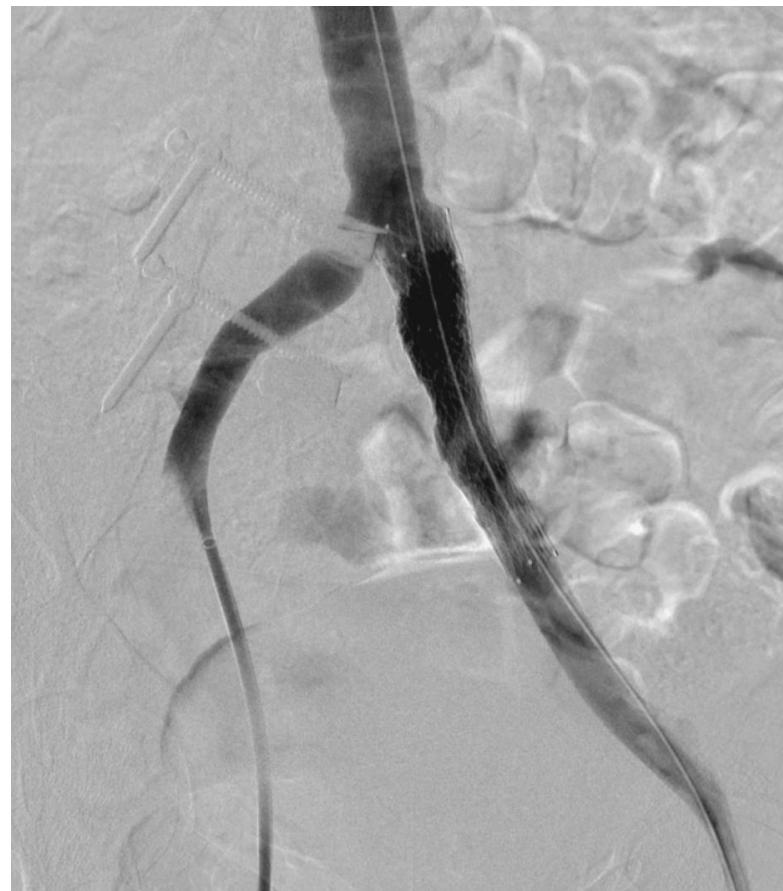

14:37Uhr

Knapp 1,5 Stunden

Keine Thrombolytika

15:53Uhr

Zusammenfassung

- Bei iliofemoraler akuter TVT ist die mechanische Thrombektomie ein sicheres und zuverlässiges Therapieverfahren
- Vermeidung eines PTS
- Behandlung der Ursache (May-Thurner, ...)
- Vermeidung von Komplikationen (LE)
- Entlassung am Folgetag
- Kein erhöhtes Blutungsrisiko wie bei CDT
- Antikoagulation und Kompressionsstrümpfe dennoch erforderlich

Vielen Dank
